"The risk of engine failure is greatest when your engine is young, NOT when it's old. You should worry more about pediatrics than geriatrics." -Mike Busch A&P/IA Mike Busch on Engines expands the iconoclastic philosophy of his groundbreaking first book Manifesto to the design, operation, condition monitoring, maintenance and troubleshooting of piston aircraft engines. Busch begins with the history and theory of four-stroke spark-ignition engines. He describes the construction of both the "top end" (cylinders) and "bottom end" (inside the case), and functioning of key systems (lubrication, ignition, carburetion, fuel injection, turbocharging). He reviews

modern engine leaning technique (which your POH probably has all wrong), and provides a detailed blueprint for maximizing the life of your engine. The second half presents a 21st-century approach to health assessment, maintenance, overhaul and troubleshooting. Busch explains how modern condition monitoring tools-like borescopy, oil analysis and digital engine monitor data analysis-allow you to extend engine life and overhaul strictly on-condition rather than at an arbitrary TBO. The section devoted to troubleshooting problems like rough running, high oil consumption, temperamental ignition and turbocharging issues is worth its weight in gold. If you want your engine to live long and prosper, you need this book.

Inadequate electricity services pose a major impediment to reducing extreme poverty and boosting shared prosperity in Sub-Saharan Africa. Simply put, Africa does not have enough power. Despite the abundant low-carbon and low-cost energy resources available to Sub-Saharan Africa, the region's entire installed electricity capacity, at a little over 80 GW, is equivalent to that of the Republic of Korea. Looking ahead, Sub-Saharan Africa will need to ramp-up its power generation capacity substantially. The investment needed to meet this goal largely exceeds African countries already stretched public finances. Increasing private investment is critical to help expand and improve electricity supply. Historically, most private sector finance has been channeled through privately financed independent power projects (IPP), supported by nonrecourse or limited recourse loans, with long-term power purchase agreements with the state utility or another off-taker. Between 1990 and 2014, IPPs have spread across Sub-Saharan Africa and are now present in 17 countries. Currently, there are 125 IPPs, with an overall installed capacity of 10.7 GW and investments of \$24.6 billion. However, private investment could be much greater and less concentrated.

South Africa alone accounts for 67 IPPs, 4.3 GW of capacity and \$14.4 billion of investments; the remaining projects are concentrated in a handful of countries. The objective of this study is to evaluate the experience of IPPs and identify lessons that can help African countries attract more and better private investment. At the core of this analysis is a reflection on whether IPPs have in fact benefited Sub-Saharan Africa, and how they might be improved. The analysis is based primarily on in depth case studies, carried out in five countries, including Kenya, Nigeria, South Africa, Tanzania and Uganda, which not only have the most numerous but also among the most extensive experience with IPPs. Ford's 351 Cleveland was designed to be a 'mid-sized' V-8 engine, and was developed for higher performance use upon its launch in late 1969 for the 1970 models. This unique design proved itself under the hood of Ford's Mustang, among other high performance cars. The

Cleveland engine addressed the major shortcoming of the Windsor engines that preceded it, namely cylinder head air flow. The Windsor engines just couldn't be built at the time to compete effectively with the strongest GM and Mopar small blocks offerings, and the Cleveland engine was the answer to that problem. Unfortunately, the Cleveland engine was introduced at the end of Detroit's muscle car era, and the engine, in pure Cleveland form, was very short lived. It did continue on as a low compression passenger car and truck engine in the form of the 351M and 400M, which in their day, offered little in the way of excitement. Renewed enthusiasm in this engine has spawned an influx of top-quality new components that make building or modifying these engines affordable. This new book reviews the history and variations of the 351 Cleveland and Ford's related engines, the 351M and 400M. Basic dimensions and specifications of each engine, along with tips for identifying both design differences and casting number(s) are shown. In addition to this, each engine's strong points and areas of concern are described in detail. Written with high performance in mind, both traditional power tricks and methods to increase efficiency of these specific engines are shared. With the influx of aftermarket parts, especially excellent cylinder heads, the 351 Cleveland as well as the 351M and 400M cousins are now seen as great engines to build. This book will walk you through everything you need to know to build a great street or competition engine based in the 351 Cleveland platform. This is the book that established Jared Taylor as an expert and commentator on race relations. The publishers of American Renaissance have reprinted this classic with a new preface for the 2004 edition by Jared Taylor. Why

read a book that first appeared in 1992? There are two reasons. First, it is still an eye-opening account of a series of terrible mistakes we have made with regard to one of the most sensitive and difficult aspects of our nations history. Some of the characters in Americas continuing racial drama have changed since 1992, but a surprising number have not, and the empty sloganeering that passes for public discourse has slackened only a little. The second reason to read this book is less important but of a certain historical interest. In its own modest way, *Paved With Good Intentions* was part of a steady evolution in what it is permitted to say about race in the American mainstream. Current safety trends encourage shooters to opt for guns of less power, especially CO2-powered guns. Several airgun shooters are not required to go through the traditional buying procedures of high-powered pistols and rifles, such as background checks and waiting periods. Plus, companies such as Colt, Smith & Wesson, and Walther manufacture high quality CO2 products that are visually indistinguishable from their traditional firearms. In this new guide to CO2-powered pistols and rifles, James E. House offers a comprehensive history of CO2 guns, dating back to the 1930s, and a discussion of propulsion, pellets, and sights. Beginning shooters are introduced to the market with a complete analysis on performance and accuracy of currently available products. Airgun enthusiasts are reunited with CO2 classics no longer being manufactured. This book also offers additional sections on target shooting, games, and varmints. Offers a comprehensive history of CO2 pistols and rifles dating back to the 1930s Includes a categorical review of BB pistols, .177 caliber pistols, .20 and .22 caliber pistols, and rifles

A revolutionary rethinking of everything we know about power. It shapes every interaction we have, whether we're trying to get a two-year-old to eat green vegetables or ask for a promotion at work. But how do we really gain power? And what does it do to us? As renowned psychologist Dacher Keltner reveals, the new science of power shows that our Machiavellian view of status is wrong. Influence comes not to those who are ruthless, but to those with social intelligence and empathy. Yet, ironically, the seductions of success lead us to lose those very qualities that made us powerful in the first place. Keltner draws on fascinating case studies to illuminate this 'power paradox', revealing how it shapes not just companies and elections but everyday relationships. As his myth-busting research shows, power - and powerlessness - distorts our behaviour, affecting whether or not we will have an affair, break the law, drive recklessly or find our purpose in life. In twenty original 'power principles', Keltner shows how we can retain power by maintaining a focus on others. By redefining power as the ability to do good, *The Power Paradox* turns everything we know about influence, status and inequality upside down. In recent times, the coalescence of different pressures has put a major strain on water supply globally. The level of water abstraction is reaching its natural limits, and this calls for a dramatic shift in water utilization concepts. This publication addresses the economic and financial issues and the methodology and procedures involved in the analysis of water recycling projects as part of a comprehensive water planning process. The issue is dealt within the wider context of water resources and covers human health, water quality,

acceptability, institutional constraints, and other factors, all of which have economic implications and affect the feasibility of reuse schemes. The recycling of urban wastewater is a key link in integrated water resource management (IWRM) that can fulfill several different, but interrelated objectives. These are expressed as win-win propositions, delivering simultaneous benefits to farmers, cities and natural environmental systems, part of solutions to the urgent global problems of food, clean water, the safe disposal of waters and the protection of the vital aquatic ecosystems.--Publisher's description. The first edition of High Power Microwaves was considered to be the defining book for this field. Not merely updated but completely revised and rewritten, the second edition continues this tradition. Written from a systems perspective, the book provides a unified, coherent presentation of the fundamentals in this rapidly changing field. The p Doctoral Thesis / Dissertation from the year 2007 in the subject Physics - Theoretical Physics, grade: 1,0, LMU Munich (Max-Planck-Institut für Quantenoptik), 193 entries in the bibliography, language: English, abstract: The investigation of laser-matter interactions calls for ever shorter pulses as new effects can thus be explored. With laser pulses consisting of only a few cycles of the electric field, the phase of these electric field oscillations becomes important for many applications. In this thesis ultrafast laser sources are presented that provide few-cycle laser pulses with controlled evolution of the electric field waveform. Firstly, a technique for phasestabilizing ultra-broadband oscillators is discussed. With a simple setup it improves the reproducibility of the phase by an order of magnitude compared to previously existing methods. In a

further step, such a phase-stabilized oscillator was integrated into a chirped-pulse amplifier. The preservation of phase-stability during amplification is ensured by secondary phase detection. The phase-stabilized intense laser pulses from this system were employed in a series of experiments that studied strong-field phenomena in a time-resolved manner. For instance, the laser-induced tunneling of electrons from atoms was studied on a sub-femtosecond timescale. Additional evidence for the reproducibility of the electric field waveform of the laser pulses is presented here: individual signatures of the electric field half-cycles were found in photoelectron spectra from above-threshold ionization. Frequency conversion of intense laser pulses by high-order harmonic generation is a common way of producing coherent light in the extreme ultraviolet (XUV) spectral region. Many attempts have been made to increase the low efficiency of this nonlinear process, e.g. by quasi phase-matching. Here, high-harmonic generation from solid surfaces under grazing incidence instead from a gas target is studied as higher efficiencies are expected in this configuration. Another approach to increasing the efficiency of high-harmonic generation is the placing of the gas target in an enhancement resonator. Additionally, the production of XUV photons happens at the full repetition rate of the seeding laser, i.e. in the region of several tens to hundreds of megahertz. This high repetition rate enables the use of the XUV light for high-precision optical frequency metrology with the frequency comb technique. With such an arrangement, harmonics up to 15th order were produced. A build-up cavity that stacks femtosecond laser pulses in a coherent manner to produce intra-cavity pulse energies of more than ten microjoules at a

repetition rate of ten megahertz is presented here... Electrical drives lie at the heart of most industrial processes and make a major contribution to the comfort and high quality products we all take for granted. They provide the controller power needed at all levels, from megawatts in cement production to milliwatts in wrist watches. Other examples are legion, from the domestic kitchen to public utilities. The modern electrical drive is a complex item, comprising a controller, a static converter and an electrical motor. Some can be programmed by the user. Some can communicate with other drives. Semiconductor switches have improved, intelligent power modules have been introduced, all of which means that control techniques can be used now that were unimaginable a decade ago. Nor has the motor side stood still: high-energy permanent magnets, semiconductor switched reluctance motors, silicon micromotor technology, and soft magnetic materials produced by powder technology are all revolutionising the industry. But the electric drive is an enabling technology, so the revolution is rippling throughout the whole of industry. AUTOMOTIVE

From the author of *Last Horizons*, Peter Hathaway Capstick now presents *Death in a Lonely Land*, a second volume of his hunting, fishing, and shooting adventures on five continents—stories collected from such magazines as *Outdoor Life*, *NRA's American Hunter*, *Guns & Ammo*, and *Petersen's Hunting*. The stockbroker-turned-outdoorsman recalls his days as an African pro hunter in "The Killer Baboons of Vlackfontein." "Four Fangs in a Treetop" records a foray into British Honduras for the jaguar, "a gold-dappled teardrop of motion." Capstick narrowly escapes the Yellow Beard, Central America's deadly tree-climbing snake, and cows "The Black Death" (Cape buffalo) in the kind of article that makes this author "the guru of American hunting fans" (*New York Newsday*). On Brazil's forsaken Marajo Island, he bags the pugnacious red buffalo, which has the "temperament of a constipated Sumo wrestler and the tenacity of an IRS man." The author discusses 12- and 20-gauge shotgun loads; recalls the pleasures of "biltong" (African beef jerky); describes the irresistible homemade lures of snook fishing expert John Gorbach; and kills a genteel take of Atlantic salmon with the brilliantly simple tube fly. Featuring more than thirty gorgeous drawings by famous wildlife artist Dino Paravano, *Death in a Lonely Land* is another collector's item by a writer who "keeps the tradition of great safari adventure alive in each of his books" (*African Expedition Gazette*). "Power-sector reform and

regulation in Africa offers detailed, up-to-date and original research into how governments and policymakers in six African countries have grappled with the development of their energy sectors. Arising out of a two-year peer-learning process involving senior executives in the electricity regulators in each country, the book contains an intelligent and clear analysis of the knowledge and shared experiences gathered in Africa by African scholars."--Publisher's note.
